

Charlemagne has requested that his contentious heirs (the players) build castles for his security and comfort in the territories he likes to visit in the course of his travels. To do this they are forced to compete for the services of the five clans of paladins (the five colors of cubes), through whom the Emperor rules his lands.

Contents

- **Rules** in English, Spanish and French
- **15 board segments** representing territories of the Empire. (Notice that the segments, of 3 different shapes, can be easily fitted together to form larger territories - a significant element of the game)
- **5 sets of discs** each numbered 1 to 5 (2 black, 2 white, and 1 gray)
- **4 courts:** small rectangular boards with the picture of a castle and along one edge a row of dots in the 5 colors

• 2 cotton bags

- one contains over 200 small wooden cubes representing the 5 paladin clans in the 5 colors
- the other contains:
 - 1 large yellow figure representing the Emperor Carolus Magnus
 - 4 dice with 5 faces in the 5 colors; the 6th face has a crown
 - 5 clan markers (wooden cylinders) in the 5 colors
 - 30 castles in 3 colors (black, white, and gray)

! Because of the new and unusual features of the game, we recommend that you first play the game with 2 players. If you choose to play your first game with 3 or 4 players, first read the rules for the 2 player version. The differences in the rules for the 3 and 4 player versions are shown at the end.

The game for 2 players

Preparation

- Place the 15 territories in a circle (leaving small empty spaces between them).
- Place the Emperor on one of the territories.
- Empty the bag with the paladin cubes in the middle of the circle of territories.
- Place the 5 colored clan markers in the middle of the circle of territories.
- Take 3 cubes of each color from the middle of the circle of territories and place them at random on the territories, 1 per territory.
 - Each player selects a color and takes a set of 10 castles and a set of 5 numbered discs in that color.
 - Each player takes a court board.
 - Return equipment not used in the 2 player game to the box: 10 castles, 3 sets of numbered discs, 2 court boards, and 1 die.
 - Each player throws the 3 dice *twice* and 1 die *once* (total 7 dice) to select his initial paladin reserve (when a crown is thrown, the player chooses one of the 5 colors). The player places the 7 paladin cubes near his court.

Place your equipment openly in front of you: reserve of 7 cubes, 10 castles, 5 discs (face up), and 1 court board. Leave space to the right of your court to place paladins during the game.

(see game in progress in figure 1)

figure 1

Playing the game

Each round has an **Opening Phase** followed by an **Action Phase**. In the Opening Phase, the players decide the *turn order* for this round and *how far* each may move the Emperor. In the Action Phase, each player, in the turn order determined in the Opening Phase, performs 3 actions in the order shown:

1. plays 3 paladins from his reserve,
2. moves the Emperor (and resolves ownership of the territory where the Emperor stops), and
3. throws the dice to replenish the 3 paladins that he played.

Opening Phase

Each player, in turn order, chooses one of his numbered discs and plays it face up just inside the circle of territories. **The numbers on the two discs must be different.** Players choose a starting player for the first round by lot. In subsequent rounds, the starting player is the player who had placed the **lower** number in the previous round. Players play their discs so they slightly cover the discs they played in previous rounds so all discs may be seen with the latest disc on top (see figure 1). If both players have the same numbered disc when each has just one left, the first player's number is considered the lower one. After every fifth round, each player picks up his 5 discs to use them again in the following opening phases.

The numbers on the discs have two purposes: they indicate the **order** in which the players will play with the **lower number playing first**, and they indicate **up to how far** the player moves the Emperor.

Example: Albert plays his number 3 disc and Bob his number 2 disc. Bob is first in the action phase and moves the Emperor 1 or 2 spaces during that part of his turn. Albert plays second and moves the Emperor 1, 2, or 3 spaces in that part of his turn.

Action Phase

The players take their turns in the action phase in the order chosen in the *Opening Phase*. First, the player who played the lower numbered disc, and second, the other player.

1. Play 3 paladin cubes

The player plays 3 of the 7 paladins in his reserve to his court or the territories. The 3 may be played as the player chooses.

The player may split the paladins as he chooses among his court and the territories. He may play all in his court, all in one or more territories, or any combination that suits him. Paladins that remain in a player's reserve are not in play. Only those played by the players are in the game and, once played, may not be moved.

When a player plays paladins to his **court**, he plays them next to the dots matching the color of the paladin played. A player *gains control* of a paladin color by having more paladins in his court of that color than his opponent has in his court. If both players have the same number, control remains with the player who had it before. When a player gains control of a color, he takes the matching colored clan marker and puts it on the corresponding color dot of his court. This indicates that he controls all paladins of that color in the territories.

When a player plays paladins in territories, he may play one or more in a single territory or play just one in each of one or more territories. A player plays paladins in a **territory** to strengthen or change control in the territory.

By adding paladins of a color he controls, a player can gain control in a territory and then move the Emperor there to place a castle of his color. Such a move is risky as it is difficult to retain control of a color. The same paladins that enable a player to take a territory may be used later by his opponent to take it away from him. Also, every paladin played by a player in a territory is one less paladin played in his court for control of the color. Thus, players often wait to play paladins in territories until later in that game when adding paladins can be decisive in determining the winner of the game.

2. Move the Emperor

The player moves the Emperor clockwise around the circle of territories. When moving the Emperor, each territory counts as a step. The player moves the Emperor at least one step, but no more steps than the number on the disc he played in the *Opening Phase*. The players examine the territory where the Emperor stops to see who controls the territory. The player who controls the region may be able to place a castle there (see details in "Castles and Territories").

Example: In game preparation, the players place one paladin in each of the 15 territories. On Anna's first turn she gains control of red by playing a red paladin at her court. She takes the red clan marker to indicate her control of the red paladins. She then moves the Emperor to a territory with a red paladin and places one of her castles there. Early in the game, placing castles is easy and players often build castles on every turn. Later in the game, this is much more difficult.

3. Replenish the paladins

The player rolls the 3 dice and takes 3 paladins from the center, matching the colors rolled on the dice, to replace the ones he played. When a player rolls a crown, he may select any color paladin.

If there are no paladins left of one of the colors in the center, each player returns an equal number of that color from his court to the center.

This concludes the player's 3 actions. When both players have taken their turns, a new round begins with another *Opening Phase* started by the player who played the lower number in the previous turn.

Castles and territories

Castles

To build a castle in a territory, a player must control a majority of the paladins in the territory and the Emperor must stop there.

Majorities are obvious at the start, when there is only one paladin in each territory. Later when players try to invade and take over each other's territories, determining control of a region is more difficult. To determine this, each player counts the paladins of the colors he controls. The one who controls the most paladins in a region **without** a castle, builds a castle. No castle is built in case of a tie. If the Emperor stops in a territory in which the paladins are controlled by neither player, which may happen in the early stages of a game, no castle is built.

Taking over the opponent's territories

Possession of a territory may not be permanent. The shift in the control of a paladin color from one player to the other or the placement of new paladins in one of the territories, can change control of the territory. When the Emperor stops in a territory in which there is already one or more castles, players check to see who has the majority and **include the castles** in the count as if they were paladins of the player whose castles they are.

figure 2

If the majority has not changed or if there is a tie, the territory is unchanged and no castle is built. A player does not add a castle to a region that already has one. If the majority in a territory has changed, **all** castles are removed and replaced with castles belonging to the player now in the majority in the territory.

A common situation for a takeover is shown in figure 2. The black castle indicates that the black player controlled the territory when the Emperor last stopped there. He controlled the 2 green paladins and the white player the red one. If the white player gains control of green in his court, he also gains the majority in the territory: 3 to 1 (the 3 paladins vs. the castle). If the Emperor now stops there, the white player would claim the territory and replace the black castle with a white one. For a more complex takeover, see figure 6.

Merging territories

One of the most important features of the game occurs when a player builds castles in adjacent territories. When a player builds a castle in a territory (either a new castle or a takeover) and has castles in one or both of the adjacent territories, the adjacent territories with castles of the same color are merged into one large territory. This larger territory contains **all** the paladins and castles of the former territories. A newly merged territory is **not** checked for a change in majority.

These merged territories are stronger and more difficult to take over than single territories because all the castles in them are counted as paladins. This also makes them very desirable targets. When a merged territory is taken over, all the castles in the territory are replaced by castles of the player who took over the territory.

Once merged, a territory cannot be divided and is regarded from then on as a single territory containing the paladins and castles of the former territories. The merged territory also counts as just one step when moving the Emperor: a move to a merged territory counts as 1 step, just as if it were a single territory. If a player builds a castle in a territory adjacent to one of his merged territories, the territories are merged into an even larger territory.

In figure 3, the Emperor has stopped in territory B, which the white player takes over from the black player (it is actually the territory in figure 2 after the takeover). As the white player has castles on A and C, he merges the three territories into one. He may fit them together any way he wants. The new territory contains the 3 old territories, 6 paladins, and 3 castles as shown in figure 4.

figure 3

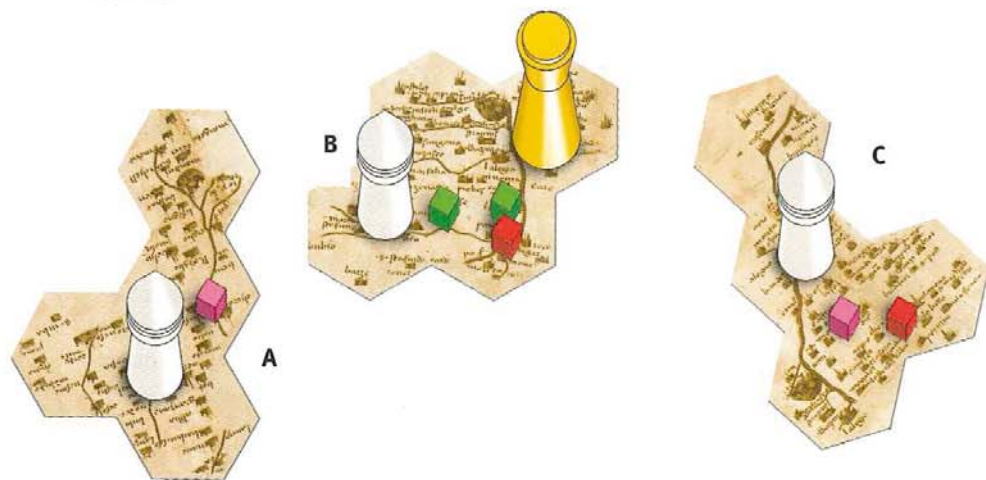

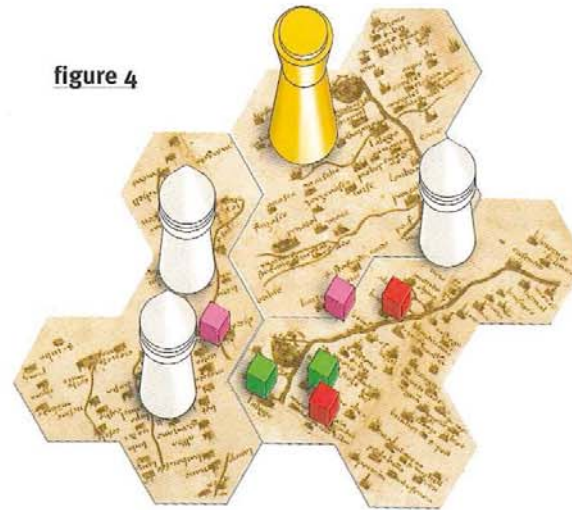

figure 4

At the courts: keep an eye on your opponent's reserves

During the game, players can improve their chances for success by watching their opponent's 7 reserve paladins as they represent his "potential" for his next turn.

For example, figure 5 shows the two players' courts and their reserve paladins. Currently, the white player controls red (7 to 6) and pink (8 to 5) while the black player controls blue (8 to 6), yellow (6 to 5) and green (5 to 3). It is the white player's turn. He sees that his control of pink is safe, for the time being, but that the one of red is in danger: the black player has 3 red paladins in his reserve that he could use overtake the white player's 7 reds on his next turn. Fortunately for the white player, he has 2 red paladins in his reserve and can protect his control of red by adding them to his court, giving him a lead of 9 to 6. This would protect his red control, at least for now. The white player also can take over control of yellow from the black player by adding 2 yellow paladins to his court. Which is better? Usually, defense is better. To make counting easier, the players have placed a small gap after each fifth cube.

figure 5

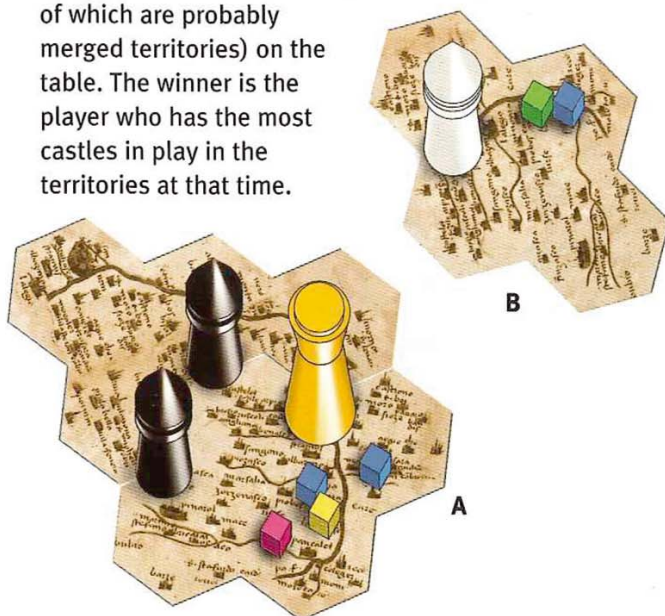

Counterattack!

Of course, defense is not always the best answer. Near the end of the game, a player may want to attack his opponent's control to effect a dramatic turnover.

Figure 6 shows a portion of the territories in a game corresponding to the courts shown in figure 5. It is still the white player's turn and he is in a poor position! The Emperor is at A. The black player has two large territories at A and C, while the white player has two small territories at B and D. If it were the black player's turn, the game would be practically over. The black player could move the Emperor to B (where he has already the majority, despite the white player's castle), and unite A, B and C in a huge territory topped by 6 black castles. Fortunately for the white player, it is not the black player's turn. The white player played his 3 disc and can move the Emperor 1, 2, or 3 steps. Moving him 1 step would be suicide, so he considers reaching temporary safety by moving the Emperor 3 steps to D. But the white player sees a better choice. The black player has a majority of 9 to 3 at C, but this includes 3 yellow paladins, which is a weakness and the white player has 3 yellow paladins in his reserve. So, he plays 2 of these at his court and gains control of yellow. Then, he plays his 3rd yellow paladin at C and moves the Emperor there. This allows the white player to take over the territory with a majority of 7 to 6 (4 yellow, 2 red and 1 pink vs. 2 green, 1 blue and 3 castles)! He removes the 3 black castles and replaces them with 3 of his white castles, joining B and D to C. From the brink of defeat, the white player has gained control of a large 5 castle territory!

End of the game

The game ends when a player has 10 castles in play in the territories. That player wins! The game also ends when there are fewer than 4 territories (most of which are probably merged territories) on the table. The winner is the player who has the most castles in play in the territories at that time.

The game for 3 players

The game for 3 players is the most demanding because it contains more elements that must be watched. Thus, we recommend you play the 2 player version at least once before playing the game with 3 players.

The rules for 3 players are the same as those for 2, except for the following:

- Players use 8 castles of each color (not 10), 4 dice, 3 courts, and 3 sets of discs (one of each color). Return 2 castles of each color, 1 court, and the 2 remaining sets of discs to the box.
- The goal is to build **8 castles** (not 10).
- Each player begins with a reserve of **9 paladins** (not 7) and, therefore, begins by throwing 9 dice (3 x 3).
- On each turn, a player plays **4 paladins** (not 3), and, therefore, replenishes 4 at the end of each turn, throwing the 4 dice to do so.
- When checking the majority in a territory, it need only be **relative**, not absolute (a player must have more than each of the other two).
- The order of play is that of the numbers on the 3 discs. This is also the order players will play their discs in the next turn.

The game for 4 players

The game for 4 players is the most exciting and dynamic version, often allowing a continuous string of surprises and dramatic turnovers.

The players play in partnerships, 2 against 2. Partners may sit opposite or next to each other. The rules are the same as the game for 2 players, except for the following:

- The 2 partners use the **same set of 10 castles**, but otherwise each player uses his own equipment as in the game for 2 (partners use discs of the same color). Return 1 die, the 10 gray castles, and 5 gray discs to the box.
- The 4 players play in the order of the numbers on the discs they play; it may, therefore, happen that partners play next to each other in turn order.
- Each player has his own court where he lines up his own paladins from his own reserve. There may be **no** passing of paladins from one court to the other.
- Colors are controlled by individual players not partnerships. A color can only be controlled by **one** player: the one who has lined up most paladins of that color in his court. The paladins in the two partners' courts are **not** added together for partnership control.
- The territories, however, are jointly controlled by the partners. When checking for a majority in a territory, the total of paladins controlled by one partnership is compared to the total controlled by the other partnership. This is the criterion used for building castles and for taking over territories.
- Players decide before the game whether partners are allowed to talk to each other. In a "serious" game there should be no talk. Remember that "unserious" games are often the best.

Strategic hints:

- *Partnership play: if your partner controls a color at his court, do not play paladins of that color at your own court, but consider playing them in the territories.*
- *Order of play: this order is even more important in a 4 player game than in the games for 2 and 3 players. In certain situations, playing in succession can be decisive. Sometimes, it is even possible to play 4 times in a row (both playing last in one turn, then first in the next one).*
- *Be alert in defending your territories. In a 4 player game, territories are relatively easier to take over because of the greater number of paladins that are played in the territories and the chance of players in a partnership playing successively.*
